

Gen AI Academy

APAC Edition

Build in APAC. Build for the world.

Participant Details

- a. **Participant name:** Manasvi Sawant
- b. **Problem Statement:** Build and deploy a **single AI agent** using **ADK** and **Gemini** that is hosted on **Cloud Run** and performs **one clearly defined task**.
The agent must be callable via an HTTP endpoint and return a valid response for a given input.

Brief about the idea

The Problem

The job market is fragmented.
Candidates jump between 5+ tools to decode job descriptions, rewrite resumes, optimize LinkedIn, and prep for interviews

The Solution – CareerCraft AI

A unified, intelligent AI Agent built with the **Google ADK**.
It doesn't just "chat"; it uses specialized tools to act as a recruiter, career coach, and LinkedIn expert all in one.

The Goal

Empower job seekers with high-fidelity, data-driven career assets in seconds.

Meeting the Build Criteria

Track Requirement	My Implementations
Agent Framework (ADK)	Developed using Google ADK 0.3.0 with a custom ReAct reasoning loop.
Generative Model	Integrated Gemini 2.5 Flash via Vertex AI for high-speed tool orchestration.
Tool Registry	Registered 5 specialized Python tools (JD Decoder, Resume Enhancer, etc.) within the ADK.
Deployment Platform	Fully containerized and hosted on Google Cloud Run for serverless scalability.
Public Accessibility	Exposed via a secure FastAPI HTTP POST endpoint for real-time interaction.

Opportunities

Agentic Intelligence (ADK Core)

Professional-grade assets with structured reasoning

Gemini 2.5 Flash Speed

Instant Response

Structured Output Engine

Role-Specific Logic

5 specialized tools

JD Decoder, Resume Enhancer, LinkedIn
Builder, & more

The problem it solves:

CareerCraft AI eliminates "tool fatigue" by replacing fragmented job-seeking workflows with a single, agentic coach that transforms generic career advice into data-backed, application-ready assets

ADK reasoning + Tool calling + Gemini 2.5 Flash = Career prep grounded in strategy, not guesswork

List of features offered by the solution

JD Decoder
Identifies hidden "red flags" and maps must-have technical skills from messy job postings.

Resume Enhancer
Uses action-verb injection and the Google-pioneered "XYZ Formula"

LinkedIn Builder
Generates SEO-optimized headlines to increase recruiter "InMail" hits.

Culture Analyzer
Scrapes/analyzes company values to suggest "Reverse Interviewing" questions.

Interview Simulator
Categorizes questions by "Behavioral," "Technical," and "Case-based" rounds.

Process flow diagram or Use-case diagram

Technologies to be used in the solution

Layer	Technology
Agent Framework	Google ADK (google-adk)
LLM	Gemini 2.5 Flash via Vertex AI
Deployment/Compute	Google Cloud Run — Serverless container hosting
Backend API	FastAPI + Uvicorn — Handling HTTP POST requests
Tool Execution	Python 3.11 — Logic for JD Decoding & Resume Enhancement
Authentication	Google Cloud IAM — Application Default Credentials (ADC)
Environment	Docker — Containerized architecture for deployment

th Gemini CLI.
Your Cloud Platform project in this session is set to career-craft-491907.
Use 'gcloud config set project (PROJECT_ID)' to change to a different project.
manasvi10045@cloudshell:~ (career-craft-491907) $ curl https://career-craft-ai-925761157342.us-central1.run.app/health
manasvi10045@cloudshell:~ (career-craft-491907) $ curl -X POST https://career-craft-ai-925761157342.us-central1.run.app/chat -H "Content-Type: application/json" \
-d '{
  "message": "Decode this JD for a fresher: We need a Python developer with REST API and cloud experience.",
  "session id": "demo-1",
  "user id": "User-1"
}'
{"response": "### What They Really Want\nThis employer is looking for a Python developer, even at a fresher level, who already has some foundational understanding and practical exposure to REST APIs and cloud platforms. They want someone who can hit the ground running with these specific technologies, rather than someone who needs extensive training in them.\n\n### Must-Have Skills\n- **Python Development:** Strong understanding of Python fundamentals and ability to write clean, efficient code.\n- **REST API Knowledge:** Familiarity with how REST APIs work, including concepts like HTTP methods (GET, POST, PUT, DELETE), status codes, and request/response structures.\n- **Cloud Experience:** Basic exposure or understanding of at least one major cloud platform (e.g., AWS, Azure, GCP). This could mean experience with basic services like virtual machines, storage, or serverless functions.\n\n### Nice-to-Have Skills\n- **Specific Cloud Platform:** If they mention a specific cloud (e.g., AWS Lambda, Azure Functions, Google Cloud Run), any experience with that platform would be a significant plus.\n- **Web Frameworks:** Experience with Python web frameworks like Flask or Django, especially if building APIs.\n- **Version Control:** Familiarity with Git.\n- **Database Knowledge:** Basic SQL or NoSQL database understanding.\n- **Red Flags (for the candidate to consider):** For a fresher role, asking for 'experience' in a specific technologies often means they expect some level of practical projects or internships, not just theoretical knowledge.\n\n### Ideal Candidate Profile\nA fresher with a Computer Science degree (or related field) who has actively pursued personal projects, participated in internships, or contributed to open source projects involving Python, building/consuming REST APIs, and deploying applications on a cloud platform (even if it's just a free tier). They are a quick learner, self-starter, and can demonstrate their technical aptitude through code samples or project portfolios.\n\n### Salary Range Hint\nFor a fresher role with these specific technical requirements, the salary could be slightly above average for an entry-level Python developer, depending on the location and company size. Expect a range that reflects the demand for these skills, but also the entry-level nature of the position. Research local market rates for 'Junior Python Developer with Cloud Experience'.manasvi10045@cloudshell:~ (career-craft-491907) $ gcloud run services describe career-craft-ai-491907
--region us-central1 \
--format='table(metadata.name, status.url, status.conditions[0].status, metadata.creationTimestamp)'\n
ERROR: (gcloud.run.services.describe) You do not currently have an active account selected.

Snapshots of the prototype

The screenshot shows a Google Cloud console window with a terminal open. The terminal displays a series of log entries for a service named 'career-craft-491907'. Each entry includes a timestamp, request method, request URL, and status. The logs show a mix of POST and GET requests to different endpoints, all returning a 200 status. The terminal prompt at the bottom indicates the user is in a cloudshell environment.
